

DATE: 19 Nov 2020

SUBJECT: Raise points to be resolved in the Latin Cargas mobile application

MODE: Video conferencing via Skype

PARTICIPANTS: Marisa, Henry and Isabel

It is required in order of importance:

- 1- Generate a test space of the application in order to keep the application stable in production while making changes and new developments. Use GitHub to generate app timeline.
- 2- Create a method of simultaneous mirror-like update of the application updates in its instances in Argentina, Colombia and Panama
- 3- Make the detailed corrections in the document left by Donato once Henry checks which points are pending
- 4- Correct the order of appearance of the app evaluation popup, it must exit at the end of the workflow which is when the client signs accepting receipt of the shipment.
- 5- Generate the app to be installed on iOS since it was sold because it can work on both android and iOS
- 6- Speed up the order saving process. It was validated that the database is recorded immediately but nevertheless it takes 15 to 20 seconds to respond to the user on the screen.

Information:

- Henry is working on the payment platform and on a geolocation problem
- In iOS it worked properly but there was an update that slowed down the saving process.
- At the beginning of the app, Expo, the react framework, was used, but it was eliminated and we are currently working with the native lines. You want to return to Expo or you listen to suggestions.

Agreements:

- Henry will send app code through GitHub to be reviewed
- In a week or less, progress of the activities will be delivered
